Summary

Full-stack engineer with **3+ years** of production ownership at Sapiens — traced and permanently fixed a **recurring P1 outage** through a storage re-architecture (**11× latency reduction, zero recurrences**), cut **15% of cloud costs** through hands-on workload profiling, and shipped **AI developer tooling** that reduced QA cycle time by **40%**. Day-to-day stack is **Angular + Spring Boot** with real production experience running async event pipelines (**Kafka, RabbitMQ**) and multi-product deployments on **Azure AKS**.

Skills

Languages: Java 8+, TypeScript, Python, SQL

Frameworks & APIs: Spring Boot, Angular, Hibernate, JPA, REST APIs

Databases: PostgreSQL, MS SQL Server, Oracle SQL

Messaging & Distributed Systems: Apache Kafka, RabbitMQ

Cloud & Infrastructure: Azure AKS, Kubernetes, Docker, Jenkins

AI Engineering: LangChain, LangChain4j, LangGraph, LangGraph4j, Azure OpenAI

Testing & Monitoring: JUnit, Jasmine, Karma, Grafana

Tools: Git, Maven

Experience

Sapiens Technologies

Aug 2023 – Present

Associate Software Developer

Bengaluru, India

- A P1 outage had been firing every few weeks — traced it through production logs to query timeouts (~1,100 ms) and connection pool exhaustion on a high-volume table. Re-designed the storage layer with **version-based table partitioning** (`versionPartitionId`) to enable partition pruning, then rewrote indexes to align with the new partition key. **Latency dropped 11× to <100 ms**. The outage has **not fired once** since deployment.
- Owned full-stack delivery of **10+ product features** for enterprise insurance clients — schema design, Spring Boot APIs, Angular UI, and production rollout — across **MS SQL, PostgreSQL, and Oracle**. Led code reviews on every feature I shipped.
- Four product teams were each independently rebuilding the same UI patterns: table filters, modal flows, form validation. Built a **shared Angular component library (10+ components)** that all four lines adopted, eliminating the redundancy and **accelerating feature delivery by ~30%**.
- Profiled Azure AKS node pool utilization and found several workloads with resource requests significantly above their actual p99 consumption. Right-sized them across environments — **15% reduction in infrastructure costs** with no SLA regressions or on-call incidents.
- Two services were making synchronous HTTP calls to each other under load — when one slowed, it pulled the other down with it. Decoupled the integration with **Apache Kafka** async event streams; both services now operate independently and have hit **zero degradation events** during high-throughput spikes since.
- Discovered **silent message loss** in a RabbitMQ consumer — events were failing with no retries, no alerts, no trace anywhere. Implemented **exponential backoff** with per-message retry tracking, error classification, and alerting. Added a retention-based cleanup job to keep queue size healthy. **Eliminated silent loss** entirely; MTTR for publishing failures dropped measurably.
- Users could hold authenticated sessions in multiple browsers simultaneously — no enforcement, no detection. Closed the gap with **Angular HTTP interceptors** for per-request token validation and a **concurrent session enforcement policy** server-side. Zero incidents reported since.

Efftronics Systems Pvt Ltd

Nov 2022 – May 2023

Software Engineering Intern

Vijayawada, India

- Wrote and validated real-time synchronization logic for a distributed control system managing **118+ remote railway signaling nodes** in a safety-critical, zero-downtime production environment — correctness was non-negotiable and failures had real-world consequences.

Projects

DevOps Agent

Python, FastAPI, Azure OpenAI, LangGraph

- Built an AI-powered CI/CD failure diagnosis agent using **Python, FastAPI, LangGraph**, and **Azure OpenAI** that automatically analyzes failed **GitHub Actions** and **Jenkins** pipelines, identifies the failing stage (build, test, deploy), and generates structured root-cause analysis with actionable remediation steps.
- Integrated the agent into the CI/CD workflow to automatically trigger on pipeline failures and notify the **PR author and reviewers** with failure summaries, probable root causes, impacted components, and prioritized fix recommendations, eliminating the need for manual log investigation.
- Implemented a multi-agent reasoning workflow that correlates build logs, test reports, deployment errors, and historical failure patterns to provide context-aware diagnostics, significantly reducing mean time to resolution (MTTR) for engineering teams.

Decision-Agentic-Testing

Java, Spring Boot, LangChain4j, LangGraph4j

- Built a **Spring Boot agentic testing engine** using **LangChain4j** and **LangGraph4j** that parses policy documents and decision trees to auto-generate, auto-fix, and batch-update test cases — **cut manual QA effort by 40%** on complex policy validation workflows.
- Exposed **REST APIs** for natural language-driven test generation so non-engineers can validate business logic without writing a single line of test code.

DecisionForge RAG

Python, LangChain, Azure OpenAI, Azure Cognitive Search

- Built a **production RAG pipeline** using **LangChain**, **Azure OpenAI**, and **Azure Cognitive Search** to ingest governance documents and normalize decision table JSON — resolved schema inconsistencies that had been causing **cascading failures** in downstream systems.
- Designed a **modular retrieval architecture** with pluggable rule-type handlers, fully decoupling document ingestion from business logic so new rule types can be onboarded without any pipeline changes.

Education

Vellore Institute of Technology (VIT)

2019 – 2023

B.Tech in Computer Science and Engineering — Network Security

CGPA: 8.82 / 10

Achievements

- **WOW Award (Outstanding Performance)** — Sapiens Technologies, Q1 and Q4 2025; one of the few engineers to receive it twice in the same year.
- **Top 10 of 600+ projects** — VIT Engineering Clinics Expo
